1 Exact null distribution of Bartels Statistic

Bartels Rank Test (of randomness) is the nonparametric version of von Neumann ratio test. Let $R_i = \text{rank}(X_i)$, $i = 1, \dots, n$, denote the rank of the i -th observation from the sample. Then the test statistic is given by

$$RVN = \frac{\sum_{i=1}^{n-1} (R_i - R_{i+1})^2}{\sum_{i=1}^n (R_i - (n+1)/2)^2}. \quad (1)$$

Note that if there are no ties, the denominator is equal to $n(n^2 - 1)/12$ and the statistic RVN in (1) is equivalent to the numerator

$$NM = \sum_{i=1}^{n-1} (R_i - R_{i+1})^2.$$

The exact distribution of NM , $4 \leq n \leq 10$, under the null hypothesis (null distribution) is given in [1]. Here we present in Table 1 the exact null distribution (left-tail probabilities) of Bartels Randomness statistic for samples of size $n = 5, \dots, 17$. Further details can be found in [2, 3, 4]

Table 1: Exact null distribution of MN, for $n = 5, \dots, 17$
